Take the equation  $ma: -nx=a$ , our formula stands thus:  $x= 4m+n$  +n This expression may be employed to advantage in 2m equations, in which the common method of completing the square would involve troublesome fractions; e. g.,  $5a-)-lla;=42$ , by our formula,  $a-Ai H5!!=2$  or 4. After performing a few examples by means of this formula, the scholar will become so familiar with it as to apply it in any instance. The common rule for completing the square after arranging the terms, is to add to both members of the equation the square of half the coefficient of the first power of the unknown quantity. Bonnycastle, Day, and others, add the following rule for particular cases: Multiply the equation into four times the coefficient of the highest power of the unknown quantity, and add to both sides the 6quare of the coefficient of the lowest power. From this rule I have derived the foregoing formula. If the highest power of the unknown quantity has no coefficient, its value may readily be determined by giving the expression the following form: .  $x= KK+g$  Example,  $z-f6z=27$ , then  $x= 27+9+3=3$  or 9.
